

**DON'T SETTLE FOR
OUT-OF-DATE SOLUTIONS.**

The old fashioned ways of removing hair like shaving, tweezing, waxing and creams are temporary and time consuming. And although electrolysis can be better than the above methods, it is an extremely slow and painful method.

But you don't have to settle for out-of-date solutions. Now you can obtain long-lasting results with laser hair removal treatments.

The New Lyra Laser with a unique feature of 1064nm, the longest wavelength and with the combination of EDP technology is the best and is the safest laser available in the world. Ruby and Alexandrite Lasers may cause pigmentary changes. The diode lasers are absorbed highly by skin and hence not safe for all skin types. Non coherent light source do not have a particular wavelength and are not delivering uniform energy resulting in overtreating some spots and undertreating other spots.

Male Back
Skin Type IV

4 Weeks Post-Treatment

Male Chin
Skin Type VI

6 Weeks Post-Treatment

**WHAT SHOULD I EXPECT
FOLLOWING THE TREATMENT ?**

Once the treatment is complete, the area exposed to the laser is cleansed and you are free to return to your normal routine. Some patients may experience a slight reddening around hair follicles following the treatment, which typically disappears within a few minutes. It is always recommended to avoid sun exposure or to use sunscreen following the laser treatment.

Hair follicles affected by the laser are lifeless and your body will attempt to cast them off over a period of time. It will seem that the hair continues to grow for one to two weeks after the procedure, but in fact these lifeless hairs will easily fall out.

Is Lyra™ right for you ?

WHY IS LYRA THE BEST SOLUTION?

The Lyra offers effective results while maintaining the normal appearance of the skin. It uses the best technology currently available for hair removal, offering outstanding results with the widest range of skin tones and hair colors. The laser beam penetrates your skin and gets absorbed in the hair follicle residing under the skin surface. The laser energy destroys the follicle with the heat it generates. Because the laser beam is large in diameter, it affects a large number of hairs simultaneously.

LYRA

Male Neck
Skin Type IV

8 Weeks Post-Treatment

Female Thigh
Skin Type IV

12 Weeks Post-Treatment

Female Upper Lip
Skin Type III

8 Weeks Post-Treatment

Unlike electrolysis, which requires a needle to be inserted into each hair follicle, this laser system can be used to quickly treat large areas of the body. It is a safe and gentle method for removing unwanted hair without skin irritation, discolouration or inflammation associated with other lasers or hair removal methods

HOW SAFE IS LYRA ?

Lyra from Laserscope, USA is the first US FDA approved hair removal Laser for all skin types including darker Indian skins. Lyra is the best solution for skin rejuvenation, wrinkle removal and leg vein treatment as well. Lyra is also CE certified and used by leading dermatologists and medial professionals throughout the world.

WHAT CAN I EXPECT DURING THE TREATMENT ?

Most patients experience a stinging, burning sensation when a laser pulse is delivered. To reduce discomfort, a cooling system automatically removes heat from the surface of your skin before, during and after the laser exposure. You will not need a general anesthesia or pain medication, but a topical anesthetic cream may be applied to sensitive areas.

HOW MANY TREATMENTS WILL BE NEEDED ?

The number of treatments required to obtain optimal results varies with hair density, hair color, skin types, the treatment area and your hair growth cycle. The density of your hair and its growth cycle are affected by many factors such as your age, ethnic background, hormones or medications. Laser treatments impair the growth capacity of hair follicles when they are in a growth cycle at the time of treatment. All hair follicles are not active at the same time. Depending upon the growth cycle of the follicles when the treatment is applied, several treatments with a few weeks in between may be required to obtain the desired effect.
